

PET/CT NETSPOT

Name: _____

Appointment Date: _____

Check-In Time: _____

An integrated PET/CT scan combines images from a positron emission tomography (PET) scan and a computed tomography (CT) scan that have been performed at the same time using the same machine. A CT scan provides detailed pictures of tissues and organs inside the body, while a PET scan reveals abnormal activity. Combining these scans creates a more complete image than either test can offer alone.

The PET/CT NETSPOT studies are performed strictly for neuroendocrine tumor imaging. The scan helps distinguish between benign and malignant disorders by assessing tissues at a cellular level.

If you have any questions regarding your exam, please feel free to call us:

WVCI: 541-683-5001

Prior to your exam	For your PET/CT exam	After your exam
 Wear comfortable loose-fitting clothing that is easy to remove.	 Drink water prior to the test, no specific amount is required.  Plan to be at the testing center for approximately 2 hours. It is important to arrive on time.  A PET/CT scan is not painful, but it requires patience. You will receive an injection in advance of the scan. It takes 60 minutes for the material to be distributed throughout your body. During this time, you will be asked to relax comfortably in a recliner in a quiet room. You will also need to be still for the entire scan, which takes approximately 30 minutes. If you're unable to arrive on time, please call at <u>least 24 hours</u> in advance to reschedule, as the NETSPOT tracer is ordered specifically for you.	 Drink at least 1 liter (4 cups) of water throughout the day.  You may eat and drink without restrictions.  A highly specialized radiologist will interpret your images and prepare a diagnostic report for your physician. Results are typically reported to your physician within a few business days following your scan.
